Scientists are gamifying the hunt for global carbon dioxide

Climate-science researchers from Arizona State University are now on a unique mission. They have started a hunt and have appealed to citizen scientists to locate all the power plants around the world and quantify their carbon-dioxide emissions through a game.

Hosted on a website called “Ventus”—the Latin word for wind—the game has a simple interface that allows users to enter basic information about the world’s power plants. By playing the game, people around the globe can help solve the climate-change problem.
